The APA is offering a number of "emerging measures" for further research and clinical evaluation. These patient assessment measures were developed to be administered at the initial patient interview and to monitor treatment progress. They should be used in research and evaluation as potentially useful tools to enhance clinical decision-making and not as the sole basis for making a clinical diagnosis. Instructions, scoring information, and interpretation guidelines are provided; further background information can be found in DSM-5-TR. The APA requests that clinicians and researchers provide further data on the instruments' usefulness in characterizing patient status and improving patient care at http://www.dsm5.org/Pages/Feedback-Form.aspx.

Measure: Clinician-Rated Severity of Nonsuicidal Self-Injury **Rights granted:** This measure may not be modified absent written permission from APA. This measure can be reproduced, either electronically or in print formats, without permission by researchers and by clinicians solely for use with their patients in private-practice, research, or hospital settings. For the avoidance of doubt, this includes that Clinicians may upload this instrument into their own pre-existing electronic health software systems for patient assessment and records when done solely for their own use with their patients. **Rights holder:** American Psychiatric Association

To request permission to include this measure in a commercial electronic health record system (EHR) or application, to translate the measure, or for any other use beyond what is stipulated above, please contact:

CLINICIAN-RATED SEVERITY OF

NONSUICIDAL SELF-INJURY

Name:			Age:		Date:				
Instructions: This clinician-rated severity measure is used for the assessment of the presence and severity of any NONSUICIDAL SELF-INJURY (NSSI) behaviors or problems. Based on all the information you have on the individual receiving care and using your clinical judgment, please rate (✓) the presence and severity of the non-suicidal self-injury behaviors or problems as experienced by the individual in the past year.									
	Level 0	Level 1	Level 2	Level 3	Level 4				
Rate the level or severity of the	None	Subthreshold	D Mild	Moderate	Severe

Instructions to Clinicians								
The Clinician-Rated Severity of Nonsuicidal Self-Injury assesses the level or severity of nonsuicidal self-injurious								
behaviors or problems that are present for this individual. The measure is intended to capture meaningful variation in								
the severity of symptoms, which may help with treatment planning and prognostic decision-making. The measure is								
completed by the clinician at the time of the clinical assessment. The clinician is asked to rate the severity of the								
nonsuicidal self-injurious behavior as experienced by the individual in the past year.								

Scoring and Interpretation

urge to self-

injure again.)

has reported urges

to self-injure again.)

The Clinician-Rated Severity of Nonsuicidal Self-Injury is rated on a 5-point scale (Level 0=None; 1=Subthreshold; 2=Mild; 3=Moderate; and 4=Severe). The clinician is asked to review all available information for the individual and, based on his or her clinical judgment, select (\checkmark) the level that most accurately describes the severity of the individual's condition.

Frequency of Use

To track changes in the individual's symptom severity over time, the measure may be completed at regular intervals as clinically indicated, depending on the stability of the individual's symptoms and treatment status. Consistently high scores on a particular domain may indicate significant and problematic areas for the individual that might warrant further assessment, treatment, and follow-up. Your clinical judgment should guide your decision.
